Table 4. Dataset and evaluation split register. Collections and split sizes. Counts are in each collection's own unit, so no total is given.

		Split size				
Collection	**Unit**	**Train**	**Dev**	**Test**	**Coverage**	**Separation rule**
			Training and held-out			
Mathematical proofs	problem	120,000	2,000	3,000	English	Hold out entire problem families
Repository patches	task	8,200	600	900	Python / C++	Disjoint repositories; freeze revision
Tool trajectories	trajectory	45,000	1,500	2,500	6 languages	Hold out goal templates and tool schemas
Long-document QA	question	18,000	800	1,200	2 domains	Split by source document before sampling
Technical manuals	document	125,000	0	5,000	12 domains	Zero dev entries are intentional
			Evaluation only			
Sealed code tasks	problem	*NA*	*NR*	750	Python	Evaluation only; dev count unspecified
Interactive tasks	episode	*NA*	100	400	Browser / CLI	Freeze environment and initial state

Synthetic data. Counts are manifest entries. 0 is an intentionally empty split, distinct from NA and NR. NA = not applicable; NR = not reported.
